

1. Problem 1: Add Two Numbers

Write a Java program that accepts two integer numbers as command-line arguments and prints their sum. The input numbers should be provided through the command line when running the program.

2. Problem 2: Subtract Two Numbers

Write a Java program that accepts two integer numbers as command-line arguments and prints their difference. The input numbers should be provided through the command line when running the program.

3. Problem 3: Calculate the Average

Write a Java program that accepts three integer numbers as command-line arguments and prints their average. The input numbers should be provided through the command line when running the program.

4. Problem 4: Find the Maximum

Write a Java program that accepts two integer numbers as command-line arguments and prints the maximum of the two numbers. The input numbers should be provided through the command line when running the program.

5. Problem 5: Calculate Area of a Rectangle

Write a Java program that accepts the length and width of a rectangle as command-line arguments and prints the area of the rectangle. The input dimensions should be provided through the command line when running the program.
